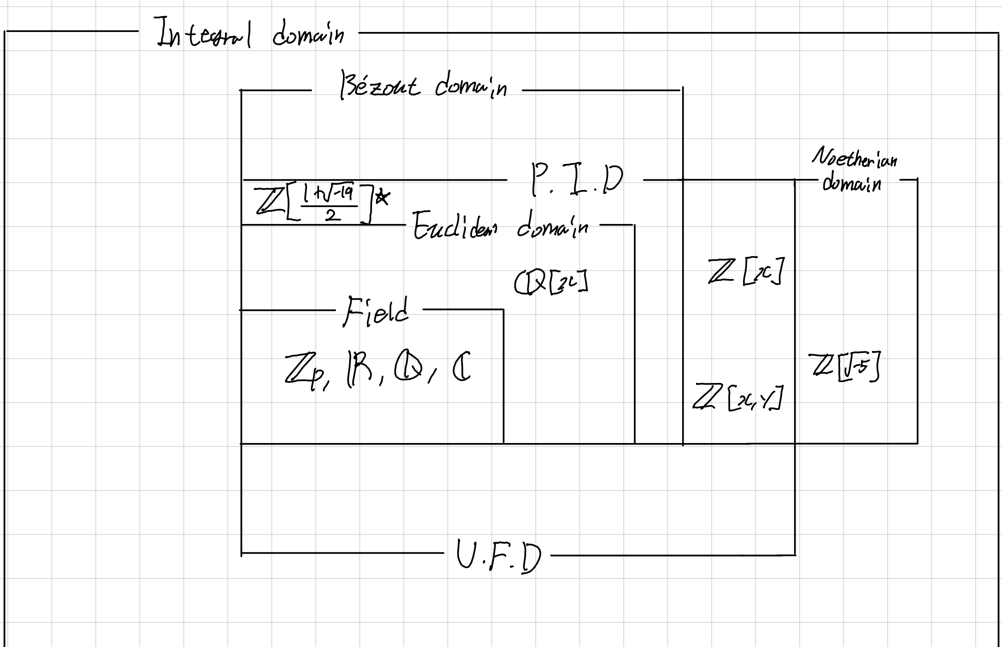
$2 \in \mathbb{Z}[x]$ U.F.D.

Maximal $\Rightarrow$ Prime $\Leftrightarrow$ Irreducible.

P.I.D $\rightarrow$ Noether $\Leftrightarrow$ Every Ideal are finitely generated $\Leftrightarrow$ A.C.C.I $\Rightarrow$ A.C.C.P $\Rightarrow$ $\exists$ factorization $\rightarrow$ U.F.D

P.I.D $\rightarrow$ Bézout $\Leftrightarrow$ Finitely generated ideal is principal $\Rightarrow$ irreducible = Prime $\Rightarrow$! factorization $\rightarrow$ U.F.D



「Basic languages for generated ideal.

「Def. Let R be a Commutative Ring, and $a, b \in R$ with $b \neq 0$.

1. a is called a multiple of b if: there exists $x \in R$ s.t $a = bx$. Simply, $b \mid a$.
2. A non-zero $d \in R$ is called a greatest common divisor of a and b if;

$$d \mid a \text{ and } d \mid b \text{ (or, } a, b \in (d)), \quad d' \mid a \text{ and } d' \mid b \Rightarrow d' \mid d.$$

$$(a, b \in (d') \Rightarrow (d) \subseteq (d'))$$

Note; $b \mid a \Leftrightarrow a \in (b) \Leftrightarrow (a) \subseteq (b)$.

Directly, $(a,b) = (d)$ implies d is the g.c.d of a and b,

but Conversely, gcd maybe does not generate the ideal; in $\mathbb{Z}[x]$,

$$(1) \neq (2, x) \quad \text{but } 1 \text{ is gcd of } 2 \text{ and } x$$

「Prop. Let R be a Commutative Ring, and $a, b, c \in R$ be given. Then,

1). $(a, b) = (a) + (b)$

2). $(c) \cdot [(a) + (b)] = (c) \cdot (a) + (c) \cdot (b) = (ca) + (cb)$.

3).
