Section 51. mathscinec.

#4. $irr(i, \mathbb{Q}) = x^2+1 \ (= (x+i)(x-i) \text{ in } \overline{\mathbb{Q}})$

$irr(\sqrt[3]{2}, \mathbb{Q}) = x^3-2 \ \left(= \prod_{k=0,1,2} (x - \sqrt[3]{2} \cdot \exp(2\pi i \cdot \tfrac{k}{3})) \text{ in } \overline{\mathbb{Q}} \right)$

$\mathbb{Q}(\sqrt[3]{2}, i)$

Take $a \in \mathbb{Q}$ satisfying

$$a \neq \frac{\sqrt[3]{2}}{2i} \cdot \left(-1 + \exp(2\pi i \cdot \tfrac{k}{3})\right) \quad (k=1,2).$$

$$= \frac{\sqrt[3]{2}}{2i}\left(-\frac{3}{2} + \frac{\sqrt{3}}{2} i\right) \text{ or } \frac{\sqrt[3]{2}}{2i}\left(-\frac{3}{2} - \frac{\sqrt{3}}{2} i\right)$$

$$\boxed{\frac{\sqrt{2}, \sqrt{3}}{\sqrt{2}+\sqrt{3}}}$$

Let $a=1$, and $\alpha = \sqrt[3]{2} + i$. Denote $\sqrt[3]{2} = \tau$. ($\tau^3 = 2$, clearly)

$\alpha^2 = \tau^2 - 1 + 2i\tau = (-1,0,1,0,2,0)$

$\alpha^3 = 2 - i + 3\tau^2 i - 3\tau = (2,-3,0,-1,0,3)$ $\quad$ * $\beta = (1, \tau, \tau^2, i, i\tau, i\tau^2)$

$\alpha^4 = 2\tau - i\tau + 6i - 3\tau^2 + 2i + 1 - 3\tau^2 - 3\tau i = (1,2,-6,8,-4,0)$

$\alpha^5 = (-8,4,0,1,2,-6) + (-12,1,2,0,8,-4) = (-20,5,2,1,10,-10)$

(Since $[\mathbb{Q}(\sqrt[3]{2}, i) : \mathbb{Q}] = 6$, α^n $(n \geq 6)$ are meaningless).

The set $\{\alpha^n \mid 0 \leq n \leq 5\}$ is linearly independent, therefore, we can find two polynomials in α as

$$i = (0,0,0,1,0,0) = \sum_{n=0}^{5} a_n \alpha^n \qquad \text{where } a_n, b_n \in F.$$

$$\sqrt[3]{2} = (0,1,0,0,0,0) = \sum_{n=0}^{5} b_n \alpha^n$$

Take $A = \left(1 \ [\alpha]_\beta \ [\alpha^2]_\beta \cdots [\alpha^5]_\beta\right) \in M_{6\times 6}(F)$

$$A\begin{pmatrix} a_0 \\ \vdots \\ a_5 \end{pmatrix} = i = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 1 \\ 0 \\ 0 \end{pmatrix} \iff \begin{pmatrix} a_0 \\ \vdots \\ a_5 \end{pmatrix} = A^{-1}\begin{pmatrix} 0 \\ 0 \\ 0 \\ 1 \\ 0 \\ 0 \end{pmatrix}$$

(Specifically, $(a_0, \dots, a_5) = \frac{1}{22} \cdot (91, 100, -13, 40, -9, 12)$)

and

$$A\begin{pmatrix} b_0 \\ \vdots \\ b_5 \end{pmatrix} = \tau = \begin{pmatrix} 0 \\ 1 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix} \iff \begin{pmatrix} b_0 \\ \vdots \\ b_5 \end{pmatrix} = A^{-1}\begin{pmatrix} 0 \\ 1 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}$$

Finally, calculating A^{-1}, we obtain the result.

Alternatively, take $\alpha = \sqrt[3]{2} i$. Then, $\underbrace{\sqrt[3]{2} = \alpha^4 \cdot \tfrac{1}{2}}_{4}$ and $\underbrace{i = -2\alpha^3}_{4}$, thus

$F(\alpha) = F(\sqrt[3]{2}, i)$.

#11. Algebraic extension of perfect is perfect.

$$\begin{array}{c} K \\ | \\ E \\ | \\ F \end{array}$$

proof. Let F be a perfect field and E/F be an algebraic extension.
Let K/E be a finite extension of E.
Suppose that K is not separable over E. Then,

$$\{K:E\} < [K:E].$$

This implies that for some $\alpha \in K$, $irr(\alpha, E)$ has common multiplicity larger than 1.
Meanwhile, since K/E finite and E/F algebraic, $\alpha \in K$ is algebraic over F.
But, since F is a perfect field, $irr(\alpha, F)$ is separable over F.
But!! $irr(\alpha, E)$ divides $irr(\alpha, F)$, it is contradiction.

#12. Let $F \leq E \leq K$, E/F algebraic, K/E algebraic.
Let $\alpha \in K$ be given. Since α is algebraic over E and E/F algebraic,
α is algebraic over F. Therefore, $irr(\alpha, F)$ exists.
By the assumption, $irr(\alpha, E)$ have common multiplicity as 1. Denote

$$irr(\alpha, E) = \sum a_n x^n \quad \text{where } a_n \in E.$$

Since $irr(\alpha, E)$ is contained in $F(a_0, \cdots, a_{\deg_E \alpha})$ with multiplicity 1,
α is separable over $F(a_0, \cdots, a_{\deg_E \alpha})$, which implies that
α is separable over F. ($F(a_0, \cdots, a_{\deg_E \alpha})$ is separable, by the assumption)

#13. Let $F_s = \{a \in E \mid a \text{ is separable over } F\}$

Clearly $F \leq F_s$. Let $\alpha, \beta \in F_s$ be given.
Since $F(\alpha \pm \beta) \subseteq F(\alpha, \beta)$ and $F(\alpha, \beta)$ is separable over F, $F(\alpha \pm \beta)$ is separable.
Similarly $F(\alpha\beta)$ and $F(\alpha/\beta)$ $(\beta \neq 0)$ too.

#14.

a). for any $\alpha \in E$, $\sigma_p^n(\alpha) = \alpha^{p^n} = \alpha$, because
the finite field of order p^n is set of zeros of $x^{p^n}-x$.
If order of σ_p is smaller than n, then it is contradiction to the above fact.

b). Since E is finite field, $E/\mathbb{Z}_p$ separable and simple extension.
And E is splitting field of $\mathbb{Z}_p$, because it is generated by all roots of $x^{p^n-1}-1$.
Now, $|G(E/\mathbb{Z}_p)| = \{E:\mathbb{Z}_p\} = [E:\mathbb{Z}_p] = n$ with
$\sigma_p \in G(E/\mathbb{Z}_p)$ has order of n,
$G(E/\mathbb{Z}_p) = \langle \sigma_p \rangle$.

$\sqrt[3]{2},\ \sqrt[3]{2}\cdot\frac{-1+i\sqrt{3}}{2},\ \sqrt[3]{2}\cdot\frac{-1-i\sqrt{3}}{2}$

「Section 53,

#4. Clearly, $[K:\mathbb{Q}(\sqrt{2},\sqrt{3})] = 2$. Thus $|\lambda(\mathbb{Q}(\sqrt{2},\sqrt{3}))| = 2$.

#7. Similarly, $[K:\mathbb{Q}(\sqrt{2}+\sqrt{6})] = 2$, gives that $|\lambda(\mathbb{Q}(\sqrt{2},\sqrt{3}))| = 2$.
(Since $[\mathbb{Q}(\sqrt{2}+\sqrt{6}):\mathbb{Q}] = [\mathbb{Q}(\sqrt{2}+\sqrt{6}):\mathbb{Q}(\sqrt{2})]\cdot[\mathbb{Q}(\sqrt{2}):\mathbb{Q}] = 4$,
$[K:\mathbb{Q}(\sqrt{2}+\sqrt{6})] = 2$.)

#11. Find $Gal(\mathbb{Q}(\sqrt[3]{2}, i\sqrt{3})/\mathbb{Q})$. Denote $\tau_k = \sqrt[3]{2}\cdot\exp(2\pi i\cdot\frac{k}{3})$ $k=1,2$

a). $\sigma_0 =$ identity. σ_1 $\sqrt[3]{2}$ maps to τ_1 and $i\sqrt{3}$ maps to $i\sqrt{3}$ 3
σ_2 " to τ_2 and " 2
σ_3 " to $\sqrt[3]{2}$ and $i\sqrt{3}$ maps to $-i\sqrt{3}$ 2
σ_4 " to τ_1 and " 3
σ_5 " to τ_2 and " 2

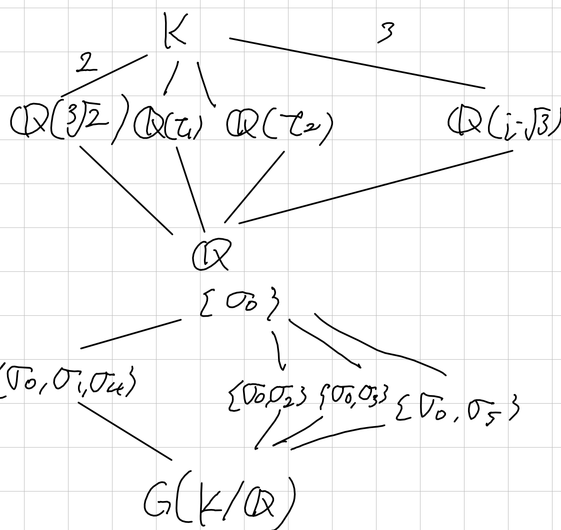
b). By the Cauchy's Theorem, group of order 6 is $\mathbb{Z}_6$ if it is Abelian, and S_3 if it is non-Abelian.

Enough to show $G(K/\mathbb{Q})$ is not Abelian. Observe that
$(\sigma_1\circ\sigma_3)(\sqrt[3]{2}) = \sigma_1(\sqrt[3]{2}) = \tau_1$ but
$(\sigma_3\circ\sigma_1)(\sqrt[3]{2}) = \sigma_3(\tau_1) = \sqrt[3]{2}\cdot(-1-i\sqrt{3})/2 \neq \tau_1$. Thus $G(K/\mathbb{Q})$ is not Abelian.

$\sigma_1^2(\sqrt[3]{2}) = \sigma_1(\tau_1) = \tau_1$.

$\sigma_5^2(\sqrt[3]{2}) = \sigma_5(\tau_2) =$

c)



#6. Since $G(K/E) \trianglelefteq G(K/F)$,

$$G(E/F) \cong G(K/F) / G(K/E)$$

and $G(K/F)$ is abelian 2're the $G(E/F)$ is abelian.

$G(K/E)$ is abelian, because it is subgroup of abelian.

Thm. Let K be a finite normal extension of F, and $F \le E \le K$. Then K is a finite normal extension of E and

$$\begin{array}{c} K \\ | \\ E \\ | \\ F \end{array}$$

$$Aut(K/E) \le Aut(K/F).$$

Moreover, two Automorphisms σ and τ in $Aut(K/F)$ are satisfied $\sigma|_E = \tau|_E$ if and only if

$$\sigma Aut(K/E) = \tau Aut(K/E)$$

Proof. Above two assertions are trivial. Let $\sigma, \tau \in Aut(K/F)$ be given.

$$\sigma Aut(K/E) = \tau Aut(K/E) \iff \tau^{-1}\sigma = \mu \text{ for some } \mu \in Aut(K/E)$$
$$\iff \sigma|_E = \tau|_E$$

Def. If K is a finite Normal Extension of F, then $Aut(K/F)$ is called

Galois Group of K over F.

Galois Theory.

Let K/F be a finite normal extension.

$$\lambda : \{E \mid F \le E \le K\} \to Gal(K/F) : E \mapsto Gal(K/E)$$

For any $F \le E \le K$, $[K:E] = |Gal(K/E)|$,
$[E:F] = (Gal(K/F) : Gal(K/E))$

E is Normal of F $\iff$ $G(K/E)$ is Normal subgroup of $G(K/F)$.

If E is Normal of F, then

$$G(E/F) \cong G(K/F)/G(K/E)$$
