⌈Lemma. Let I be a proper ideal of an integral domain R.
If a non-constant monic polynomial $p(x) = x^n + a_{n-1}x^{n-1} + \cdots + a_1 x + a_0$ satisfies

$$\bar{p}(x) = x^n + (a_{n-1}+I)x^{n-1} + \cdots + (a_1+I)x + (a_0+I) \in (R/I)[x]$$

cannot be factored two smaller degree polynomials, ($\Leftrightarrow$ irreducible)
then $p(x)$ is irreducible in $R[x]$.
Proof. Suppose that $\bar{p}(x)$ cannot be factored, and $p(x)$ is reducible.
That is, $p(x) = a(x) \cdot b(x)$ where $a(x), b(x)$ are non-constant monic polynomial.
Then, $\bar{a}(x)$ and $\bar{b}(x)$ is the factor of $\bar{p}$, it is contradiction.

⌈Eisenstein Criterion.
Let P be a prime ideal in the integral domain R.
Suppose that a non-constant monic polynomial

$$f(x) = x^n + a_{n-1}x^{n-1} + \cdots + a_1 x + a_0 \in R[x]$$

satisfies $a_{n-1}, \cdots, a_1, a_0 \in P$ but $a_0 \notin P^2$, then f is irreducible.
Proof. Suppose that $f(x)$ is reducible, factored as $f(x) = a(x)\, b(x)$,
where $a(x)$ and $b(x)$ are monic, degree smaller than $f(x)$. Denote
$a(x) = x^r + \alpha_{r-1}x^{r-1} + \cdots + \alpha_1 x + \alpha_0$ and
$b(x) = x^s + \beta_{s-1}x^{s-1} + \cdots + \beta_1 x + \beta_0$. Then, By the assumption,

$$\bar{f}(x) = x^n + (a_{n-1}+P)x^{n-1} + \cdots + (a_0+P) = x^n = \bar{a}(x)\,\bar{b}(x).$$

Since P is prime, R/P is again the integral domain,
So either $\bar{\alpha}_0$ or $\bar{\beta}_0$ is zero. WLOG, let $\bar{\alpha}_0 = 0$.
Then, $\bar{\alpha}_1 \cdot \bar{\beta}_0$ must be zero, as the unique degree 1 coefficient of $\bar{f}$,
So $\bar{\alpha}_1$ or $\bar{\beta}_0$ is zero. if $\bar{\beta}_0$, then $\alpha_0, \beta_0 \in P \Rightarrow \alpha_0\beta_0 \in P^2$, contradiction
If $\bar{\alpha}_1 = 0$, then similarly, $\bar{\beta}_0 = 0$ or $\bar{\alpha}_2 = 0$. Inductively, if $\bar{\alpha}_{r-1} = \cdots = \bar{\alpha}_1 = \bar{\alpha}_0 = 0$,
then $1 \cdot \bar{\beta}_0 = 0$, so, $\bar{\beta}_0 = 0$, or $\beta_0 \in P$. Now, $\alpha_0\beta_0 \in P^2$, thus proved.
