

## Quotient Space

Def. Let  $(X, \mathcal{C})$  be a Topological space, and  $Y$  be a set.

For an onto map  $f: X \rightarrow Y$ , define a Quotient Topology on  $Y$  induced by  $f$  as

$$\mathcal{C}_Q \stackrel{\text{def}}{=} \{U \subseteq Y \mid f^{-1}[U] \text{ is open of } (X, \mathcal{C})\}.$$

It is actually a Topology on  $Y$ , because: clearly,  $\emptyset, Y \in \mathcal{C}_Q$  and

$$U_\alpha \in \mathcal{C}_Q \ (\alpha \in I) \Rightarrow f^{-1}\left[\bigcup_{\alpha \in I} U_\alpha\right] = \bigcup_{\alpha \in I} f^{-1}[U_\alpha] \text{ is also open in } X, \text{ so is } \bigcup U_\alpha.$$

Similarly,  $f^{-1}\left[\bigcap_{\alpha \in I} U_\alpha\right] = \bigcap_{\alpha \in I} f^{-1}[U_\alpha]$  also open if  $I$  is finite, so is  $\bigcap U_\alpha$ .

Moreover, it is the finest Topology on  $Y$  such that  $f$  is Continuous, because

$$f: X \rightarrow Y \text{ is continuous iff } \forall U \in \mathcal{C}_Y, f^{-1}[U] \in \mathcal{C}_X \text{ iff } \mathcal{C}_Y \subseteq \mathcal{C}_Q.$$

where  $\mathcal{C}_Y$  is arbitrary Topology on  $Y$ .  $\square$

Def. Let  $X$  be a Topological Space, and  $\sim$  be an equivalence relation on  $X$ .

Define the Canonical map on  $X$  as

$$\pi: X \rightarrow X/\sim : x \mapsto [x]$$

The  $(X/\sim, \mathcal{C}_\pi)$  is called Quotient Space where  $\mathcal{C}_\pi$  is a Quotient topology on  $X/\sim$ , induced by  $\pi$ .

Let  $X$  be a Topological Space,  $\sim$  be an equivalence relation on  $X$ ,  $\pi$  be a Canonical map.  
 Lemma. Let  $Z$  be a Topological Space and a map  $g: X/\sim \rightarrow Z$ ,

$g$  is Continuous if and only if  $g \circ \pi$  is Continuous.

Proof. Since  $\pi: X \rightarrow X/\sim$  is Continuous, trivially  $g \circ \pi$  is Continuous.

Conversely, assume  $g \circ \pi$  is Continuous. Then, given an open  $U \subseteq Z$ ,

$(g \circ \pi)^{-1}[U] = \pi^{-1}[g^{-1}[U]]$  is open of  $X$ , so  $g^{-1}[U]$  is open of  $X/\sim$ .  $\square$

Lemma. Let  $Z$  be a Topological Space.

If a Continuous map  $f: X \rightarrow Z$  satisfies  $x \sim y \Rightarrow f(x) = f(y)$ ,  
 then a map induced by  $f$ :

$$\bar{f}: X/\sim \rightarrow Z: [x] \mapsto f(x)$$

is Continuous and it is a Unique map such that  $\bar{f} \circ \pi = f$ .

Proof.  $\bar{f}$  is well-defined by:  $[x] = [y] \Leftrightarrow x \sim y \Rightarrow f(x) = f(y)$ .

Given  $x \in X$ ,  $f(x) = \bar{f}([x]) = \bar{f}(\pi(x)) = (\bar{f} \circ \pi)(x)$ , so  $\bar{f} \circ \pi = f$

By the Lemma above,  $\bar{f}$  is Continuous. And, given a map  $g: X/\sim \rightarrow Z$  s.t.  $g \circ \pi = f$ ,

$$g([x]) = g(\pi(x)) = f(x) = \bar{f}([x])$$

So the Uniqueness is guaranteed.

Lemma. Let  $Z$  be a Topological Space.

If a Continuous onto map  $f: X \rightarrow Z$  satisfies  $x \sim y \Leftrightarrow f(x) = f(y)$  and either open or closed  
 then a map induced by  $f$ :

$$\bar{f}: X/\sim \rightarrow Z: [x] \mapsto f(x)$$

is Homeomorphism.

Quotient map.

Def. Given Topological space  $X$  and  $Y$ , a map  $f: X \rightarrow Y$  is called a quotient map if:  
 $f$  is Continuous, Onto, and satisfies for any  $U \subseteq Y$ ,

$U$  is open in  $Y \xLeftrightarrow[\text{Quotient}]{f \text{ Continuous}} f^{-1}[U]$  is open in  $X$ .

Prop. Composition of Quotient map is also Quotient map.

Proof Let  $f: X \rightarrow Y$  and  $g: Y \rightarrow Z$  be Quotient maps. Given open set  $U \subseteq Z$ ,

$(g \circ f)^{-1}[U]$  is open  $\Leftrightarrow f^{-1}[g^{-1}[U]]$  is open  $\Leftrightarrow g^{-1}[U]$  is open  $\Leftrightarrow U$  is open

And,  $(g \circ f)[X] = g[f[X]] = g[Y] = Z$ ,  $(g \circ f)$  is a Quotient map.  $\square$

Prop. If a Continuous Onto map  $f: X \rightarrow Y$  is either open or closed map, then  $f$  is Quotient map.

Proof Given  $U \subseteq Y$ , if  $f^{-1}[U]$  is open then  $f[f^{-1}[U]] = U$  is open, if  $f$  is open map.

And, if  $f^{-1}[U]$  is open, then  $f[X \setminus f^{-1}[U]]$  is closed if  $f$  is closed map.

Since  $f$  is onto,  $X \setminus f^{-1}[U] = f^{-1}[Y \setminus U] = f^{-1}[Y \setminus U]$ , so

$f[X \setminus f^{-1}[U]] = f[f^{-1}[Y \setminus U]] = Y \setminus U$  is closed, or  $U$  is open.  $\square$

But, there is a quotient map neither open nor closed: define  $X = \{(x, y) \in \mathbb{R}^2 \mid x \geq 0 \text{ or } y = 0\}$ .

$f: X \rightarrow \mathbb{R}; (x, y) \mapsto x$

Then, it is clearly onto, and Continuous is given by: for any  $a < b$  in  $\mathbb{R}$ ,

$f^{-1}[(a, b)] = [(a, b) \times \mathbb{R}] \cap X$  is open.

To show  $f$  is quotient map, suppose that  $f^{-1}[U]$  is open for some  $U \subseteq \mathbb{R}$ .

Given  $x \in U$ ,  $f((x, 0)) = x \in U$ , so  $(x, 0) \in f^{-1}[U]$ . Since  $f^{-1}[U]$  is open, for some  $\epsilon > 0$ ,  $(x, 0) \in B_\epsilon((x, 0)) \cap X \subseteq f^{-1}[U]$ . Thus,  $f[B_\epsilon((x, 0))] = (x - \epsilon, x + \epsilon) \cap f[X] = (x - \epsilon, x + \epsilon) \subseteq U$ .  
So,  $U$  is open.

Moreover,  $B_1((0, 2)) \cap X$  is open of  $X$ , but  $f[B_1((0, 2)) \cap X] = [0, 1]$ , not open.

And,  $F = \{(\frac{1}{n}, n) \mid n \in \mathbb{N}\}$  is closed because  $F' = \emptyset$  so  $F = \overline{F}$ .

But,  $f[F] = \{\frac{1}{n} \mid n \in \mathbb{N}\}$  is not closed in  $\mathbb{R}$ , since  $0 \notin f[F]$  but  $0 \in f[F]'$ .

Comment: A projection  $\pi: \mathbb{R}^2 \rightarrow \mathbb{R}$  cannot be Closed map:  $F = \{(\frac{1}{n}, n) \mid n \in \mathbb{N}\}$ .
