

Def.

A space X is called a Kolmogorov (or T_0) space if: given $x, y \in X$ with $x \neq y$, there exists an open set $U \subseteq X$ such that either $\begin{cases} x \in U \\ y \notin U \end{cases}$ or $\begin{cases} x \notin U \\ y \in U \end{cases}$.

Prop.

X is T_0 space if and only if $x \neq y \Rightarrow \overline{\{x\}} \neq \overline{\{y\}}$

Def.

A space X is called a Fréchet space (or T_1) if: given $x, y \in X$ with $x \neq y$, there exists open sets $U, V \subseteq X$ such that $\begin{cases} x \in U \\ y \notin U \end{cases}$ and $\begin{cases} x \notin V \\ y \in V \end{cases}$

Prop.

X is T_1 -space if and only if for all $x \in X$, $\overline{\{x\}} = \{x\}$.

Proof. Suppose that X is T_1 -space. Let $x \in X$ be fixed. Given $y \in X \setminus \{x\}$, there exists an open $U_y \subseteq X$ such that $x \notin U_y$ and $y \in U_y$. So,

$$\bigcup_{y \in X \setminus \{x\}} U_y = X \setminus \{x\}, \text{ because } \bigcup_{y \in X \setminus \{x\}} U_y \supseteq X \setminus \{x\} \text{ but it does not contain } x.$$

Now, since union of open sets is open, the complement $\{x\}$ is closed set.

By the definition of closure, we obtain $\overline{\{x\}} = \{x\}$.

Conversely, let $x, y \in X$ be distinct points. Then,

$$\begin{cases} x \in X \setminus \{y\} \\ y \notin X \setminus \{y\} \end{cases} \text{ and } \begin{cases} x \notin X \setminus \{x\} \\ y \in X \setminus \{x\} \end{cases}, \text{ so Proved } \Rightarrow$$

Note: By definition, trivially $T_2 \Rightarrow T_1 \Rightarrow T_0$.
