

Def.

Let  $G$  be a group, and  $A \subseteq G$  be a non-empty subset.

Define  $C_G(A) \stackrel{\text{def}}{=} \{g \in G \mid gag^{-1} = a \text{ for all } a \in A\}$ , which is called the Centralizer,

and  $N_G(A) \stackrel{\text{def}}{=} \{g \in G \mid gAg^{-1} = A\}$ , which is called the Normalizer.

Prop. Let  $G$  be a group, and  $A \subseteq G$  be a non-empty subset, and  $H \leq G$ .

- 1).  $N_G(A)$  and  $C_G(A)$  are subgroup of  $G$ .
- 2) The normalizer  $N_G(H)$  is the largest subgroup such that  $H$  is normal.
- 3). A subgroup  $H \leq G$  satisfies  $H \leq C_G(H)$  if and only if  $H$  is abelian.
