

Def. Let X be a Topological Space. A tuple of open sets $\{U, V\}$ is called Separation of X if:
 $U \neq \emptyset, V \neq \emptyset, U \cap V = \emptyset, U \cup V = X$.

If the separation exists, then X is called disconnected.

Thm. If X is connected and $f: X \rightarrow Y$ is continuous, then $f[X]$ is connected subspace.

Proof. Suppose that $f[X]$ is disconnected. Let $\{U, V\} \subseteq \mathcal{O}_{f[X]}$ be a separation of $f[X]$.

That is, $U \neq \emptyset, V \neq \emptyset, U \cap V = \emptyset, U \cup V = f[X]$.

Then, $f^{-1}[U] \neq \emptyset, f^{-1}[V] \neq \emptyset, f^{-1}[U \cap V] = f^{-1}[U] \cap f^{-1}[V] = \emptyset, f^{-1}[U \cup V] = f^{-1}[U] \cup f^{-1}[V] = X$.

Since f is continuous, $\{f^{-1}[U], f^{-1}[V]\}$ is a separation for X . Contradiction.

Thm. If $A \subseteq X$ is connected and $A \subseteq B \subseteq \overline{A}$, then B is connected.

Proof. Suppose that B is disconnected. Then, there are opens $U, V \subseteq X$ such that

$$U \cap B \neq \emptyset, V \cap B \neq \emptyset, U \cap V \cap B = \emptyset, U \cup V \supseteq B.$$

And, since $B \subseteq \overline{A}$, $U \cap \overline{A} \neq \emptyset$ and $V \cap \overline{A} \neq \emptyset$.

If $U \cap A = \emptyset$, then $A \subseteq U^c$, so $\overline{A} \subseteq U^c$. But this implies $\overline{A} \cap U^c = \emptyset$, contradiction.

Thus $U \cap A \neq \emptyset$, and similarly $V \cap A \neq \emptyset$. Moreover,

$$\emptyset = U \cap V \cap B \supseteq U \cap V \cap A, \text{ and } U \cup V \supseteq B \supseteq A, \text{ so}$$

$\{U, V\}$ is also separation of A , but it contradicts.

Thm. If subspaces $A_\alpha \subseteq X$ ($\alpha \in I$) are connected and $\bigcap_{\alpha \in I} A_\alpha \neq \emptyset$, then $\bigcup_{\alpha \in I} A_\alpha$ is connected.

Proof. Denote $A = \bigcup_{\alpha \in I} A_\alpha$. Suppose that A is disconnected by the separation $\{U, V\}$. That is, U, V are open s.t. $U \neq \emptyset, V \neq \emptyset, U \cap V = \emptyset, U \cup V = A$.

Let $\alpha \in \bigcap_{\alpha \in I} A_\alpha$ be given. Then, for all $\alpha \in I$, $\alpha \in A_\alpha$, thus $\alpha \in A$.

If $\alpha \in U$, put for each $\alpha \in I$, $U_\alpha = U \cap A_\alpha$ and $V_\alpha = V \cap A_\alpha$. Then, $\alpha \in U \cap A_\alpha \neq \emptyset$, $U_\alpha \cap V_\alpha = U \cap V \cap A_\alpha = \emptyset$, $U_\alpha \cup V_\alpha = (U \cup V) \cap A_\alpha = A_\alpha$. Since A_α is connected, $V_\alpha = V \cap A_\alpha$ must be empty. But,

$$V = V \cap A = V \cap \left(\bigcup_{\alpha \in I} A_\alpha \right) = \bigcup_{\alpha \in I} (V \cap A_\alpha) = \bigcup_{\alpha \in I} V_\alpha = \emptyset.$$

Contradiction. If $\alpha \in V$, it can be proved similarly. $\square$

Corollary. If $A_n \subseteq X$ ($n \in \mathbb{N}$) are connected, and for all $n \in \mathbb{N}$,

$$\left(\bigcup_{i=1}^n A_i \right) \cap A_{n+1} \neq \emptyset$$

then $\bigcup_{n=1}^{\infty} A_n$ is connected.

Proof. Take $B_n = A_1 \cup \dots \cup A_n$. And using induction. (Use $\bigcup_{n=1}^{\infty} A_n = \bigcup_{n=1}^{\infty} B_n$)

Thm. Product of Connected space is Connected.

Proof. It holds in arbitrary product, but in this, prove only finite case
Let X, Y be Connected Space. For any $x \in X$ and $y \in Y$,

$$X \times \{y\} \cong X \quad \text{and} \quad \{x\} \times Y \cong Y$$

are Connected. Moreover, $X \times \{y\} \cap \{x\} \times Y = \{(x, y)\} \neq \emptyset$. Therefore

$$(X \times \{y\}) \cup (\{x\} \times Y)$$

is Connected. Let $b \in Y$ be fixed. Then, for any $x \in X$,

$$T_x = (X \times \{b\}) \cup (\{x\} \times Y)$$

is Connected, and $T_x \supseteq X \times \{b\}$. Thus, $X \times \{b\} \subseteq \bigcap_{x \in X} T_x \neq \emptyset$.

Now, $X \times Y = \bigcup_{x \in X} T_x$ is Connected.

4 Arbitrary Product Case

Let X_α ($\alpha \in I$) be Connected Spaces, and put $X = \prod_{\alpha \in I} X_\alpha$.

Let $(b_\alpha)_{\alpha \in I} \in X$ be fixed. Then, for any finite subset $\{\alpha_1, \dots, \alpha_n\} \subseteq I$,

$$X_{(\alpha_1, \dots, \alpha_n)} = \{(x_\alpha)_{\alpha \in I} \in X \mid \alpha \notin \{\alpha_1, \dots, \alpha_n\} \Rightarrow x_\alpha = b_\alpha\}.$$

Then, $X_{(\alpha_1, \dots, \alpha_n)} \cong X_{\alpha_1} \times \dots \times X_{\alpha_n}$, so it is Connected.

Moreover, for a Collection $\mathcal{F}$ of every finite subsets of I ,

$\bigcap_{\{\alpha_1, \dots, \alpha_n\} \in \mathcal{F}} X_{(\alpha_1, \dots, \alpha_n)}$ contains (b_α) , so non-empty.

$Y = \bigcup_{\{\alpha_1, \dots, \alpha_n\} \in \mathcal{F}} X_{(\alpha_1, \dots, \alpha_n)}$ is Connected.

So, Y is also Connected, enough to show $X = Y$.

Let $\prod_{\alpha \in I} U_\alpha \subseteq X$ be a basis element of X . By def, all but finitely many $U_\alpha = X_\alpha$.

So, for some finite $\{\alpha_1, \dots, \alpha_n\} \subseteq I$ s.t. $U_\alpha = X_\alpha$ if $\alpha \notin \{\alpha_1, \dots, \alpha_n\}$

then $\prod_{\alpha \in I} U_\alpha \cap Y \neq \emptyset$. So proved

Def. Let X be a Topological space. Define a relation $\sim$ on X as:

$$x \sim y \Leftrightarrow \exists \text{ connected subspace } A \subseteq X \text{ s.t. } x \in A \text{ and } y \in A.$$

Then, it is equivalent relation; reflexivity and Symmetry are clear, and transitivity: $x \sim y$ by A and $y \sim z$ by B , then $x \sim z$ by $A \cup B$.

Define Connected Component of X as:

$$C_x = [x]_{\sim}$$

Lemma. Let X be a Tps. Let $x \in X$ be given.

1). C_x is the largest Connected subset containing x .

2). If $A \neq \emptyset$ is connected subset of X , then there is Unique Connected Component $C \supseteq A$.

3). Connected Component is closed.

Proof of 1). Let $A \subseteq X$ be a Connected subset containing x . Then,

$$y \in A \Rightarrow x \sim y \Rightarrow y \in C_x, \text{ so } A \subseteq C_x.$$

Moreover, C_x is connected, because: given $z \in C_x$, there is a Connected subset A_z s.t. $x, z \in A_z \subseteq C_x$. Now, since $\bigcap_{z \in C_x} A_z$ contains x , so nonempty, thus

$$C_x = \bigcup_{z \in C_x} A_z \text{ is connected.}$$

2) is trivial. Fixed $x \in A$, $a \in A \Rightarrow a \in C_x$. The uniqueness is given by the reflexivity

3). $C_x \subseteq \overline{C_x}$ trivially, and $\overline{C_x}$ is connected, so $\overline{C_x} \subseteq C_x$.

Thm. The Homeomorphism Preserves the Cardinality of Connected Components.

Proof. Let X and Y be Homeomorphic Topological Space with Homeomorphism $f: X \rightarrow Y$. Given $x \in X$, there is a unique Connected Component of x , $C_x \subseteq X$.

Since the Connectedness is preserved by Continuous map, $f[C_x]$ is Connected subset, containing $f(x)$. So, $f[C_x] \subseteq C_{f(x)}$. Similarly, $f^{-1}[C_{f(x)}] \subseteq C_{f^{-1}(f(x))} = C_x$.

Therefore, for any $x \in X$, $f[C_x] = C_{f(x)}$. Similarly, given $y \in Y$, $f^{-1}[C_y] = C_{f^{-1}(y)}$.

Now, define a map $\phi: \{C_x | x \in X\} \rightarrow \{C_y | y \in Y\}; C_x \mapsto C_{f(x)}$

Then, ϕ is one-to-one:

$$C_{f(x_1)} = C_{f(x_2)} \Leftrightarrow f[C_{x_1}] = f[C_{x_2}], \text{ since } f \text{ is Homeo, } C_{x_1} = C_{x_2}$$

(Take f^{-1} to the both sides.) And, given C_y from the Co domain, there is $x \in X$ st $y = f(x)$. So $\phi(C_x) = C_{f(x)} = C_y$. $\square$

Thm. If a Topological Space X has only finite Connected Components, then every Components are Clopen.

Proof. Let $C_1, \dots, C_n$ be all Connected Components of X . Then for each i ,

$$C_i = X \setminus \left[\bigcup_{j \neq i} C_j \right]$$

is open.

Def. Let X be a Topological space.

We said X is locally Connected at $x \in X$ if:

For any open $N \subseteq X$ containing $x \in X$, there is connected open V s.t. $x \in V \subseteq N$.

X is called locally Connected, if it is locally connected at every point.

Thm. X is locally Connected if and only if:

for any open $U \subseteq X$, every Connected component of U is open.

Proof. Suppose that X is locally Connected space. Given an open set $U \subseteq X$, let $C \subseteq U$ be a Connected Component of the subspace U since X is l.c. connected, given $x \in C$, there is a Connected open set V_x s.t. $x \in V_x \subseteq U$.

Since C is Connected Component of x , $V_x \subseteq C$. So,

$$C = \bigcup_{x \in C} V_x \text{ is open set.}$$

Conversely, let $x \in U$ be given. Then, there is open Connected component $C_x \subseteq U$ exists.

Above definition and theorem are same in the case of Path-Connected.

Thm. If X is locally path-connected, then the Connected component and path component are same.

Proof. Let $C \subseteq X$ be a Connected Component. Given $x \in C$, let P_x be a path component of x .

Since P_x is Path-Connected, so Connected, thus $P_x \subseteq C$.

To show $P_x = C$, Suppose that $P_x \subsetneq C$. Let $\mathcal{Q}$ be the union of:

$$\{P_y \mid P_y \text{ is a path-component of } X \text{ s.t. } P_y \not\subseteq P_x \text{ and } P_y \cap C \neq \emptyset\}.$$

Then, for each P_y is contained in C , so that $C = P_x \cup \mathcal{Q}$.

Since X is locally path connected, P_x and $\mathcal{Q}$ are open, so these become the separation for C , it is contradiction.

Corollary. If X is locally path-connected, then

Path Connected $\Rightarrow$ Connected.

Thm. Quotient map preserves locally connected by image.

Proof. Let X be a locally connected and $p: X \rightarrow Y$ be a quotient map.

Let $C \in Y$ be a connected component of an open set U of Y .

Then, clearly $p^{-1}[C] \subseteq p^{-1}[U]$. Given $x \in p^{-1}[C]$, there is a connected component $C_x \ni x$.

Then, $p[C_x] \in p[p^{-1}[C]]$ is connected, so $p[C_x] \subseteq C$, or $C_x \subseteq p^{-1}[C]$.

So, $p^{-1}[C] = \bigcup_{x \in p^{-1}[C]} C_x$ and since C_x are components of open set $p^{-1}[U]$,

So these are open, since X is locally connected.

Now, $p^{-1}[C]$ is open, so is C open, since p is quotient map. $\square$

Thm. Quotient map preserves locally path-connected by image.

Summary,

Def. Let X be a Topological space.

If for any $a, b \in X$, there is a continuous map

$$p_a^b: [0, 1] \rightarrow X \text{ s.t. } p_a^b(0) = a \text{ and } p_a^b(1) = b$$

then X is called path-connected.

Thm Path-Connected $\Rightarrow$ Connected.

Proof. Suppose that X is disconnected, but path-connected.

Let $\{U, V\}$ be the separation for X . Given $a \in U$ and $b \in V$,

there exists a path $p: [0, 1] \rightarrow X$ s.t. $p(0) = a$, $p(1) = b$.

Since p is continuous and $[0, 1]$ is connected, $\text{Im } p$ is connected, but

$$U \cap \text{Im } p \ni a, \quad V \cap \text{Im } p \ni b, \quad U \cap V \cap \text{Im } p = \emptyset, \quad U \cup V \supseteq \text{Im } p$$

so, $\{U, V\}$ is the separation for $\text{Im } p$, it is contradiction

Thm. Let X be a space. If $A_\alpha \subseteq X$ ($\alpha \in \mathcal{A}$) are path-connected with $\bigcap_{\alpha \in \mathcal{A}} A_\alpha \neq \emptyset$, then $\bigcup_{\alpha \in \mathcal{A}} A_\alpha$ is path-connected.

Proof.

Topologist's Sine Curve.

Def. In $\mathbb{R}^2$, let $L = \{0\} \times [0, 1]$ and $S = \{(x, y) \mid x > 0, y = \sin \frac{1}{x}\}$.

Then, the subspace $L \cup S$ is called the Topologist's Sine Curve.

It has the following properties:

1). Connected.

Since $x \mapsto \sin \frac{1}{x}$ ($x > 0$) is continuous, the graph S is connected.

And, since $L \cup S \subseteq \overline{S}$, ($L \subseteq \overline{S}$, so $L \cup S \subseteq \overline{S}$),

$L \cup S$ is also connected, by A connected $\Rightarrow \exists$ st $A \subseteq B \subseteq \overline{A}$ is connected.

2. Not path-connected.

S is path-connected, since $(0, \infty)$ is path-connected and $x \mapsto \sin \frac{1}{x}$ is continuous.

But, for $(0, 0) \in L$ and $(1, \sin 1) \in S$, there is no path between $(0, 0)$ and $(1, \sin 1)$.

(This is also the counter-example for S path. conn. but $\overline{S}$ is not.)

suppose that there is a path $p: [0, 1] \rightarrow L \cup S$ from $(0, 0)$ to $(1, \sin 1)$.

Let $t_0 = \sup \{t \in [0, 1] \mid p(t) \in L\} = \sup p^{-1}[L]$.

Since L is compact, $t_0 \neq 1$. (If $t_0 = 1$, then $p(t)$ cannot be $(1, \sin 1)$).

Meanwhile, for any $\delta > 0$, there is $t_0 < t' < t_0 + \delta$ such that

$$|\pi_y(p(t_0)) - \pi_y(p(t'))| \geq \frac{1}{2}, \text{ so}$$

it is contradiction to p is continuous. (π_y is a projection onto Y)
