

Def. Let G be a group. Define

$$G^{(0)} = G \quad \text{and} \quad G^{(i+1)} = [G^{(i)}, G^{(i)}] \quad (i \in \mathbb{N}).$$

The descending chain

$$G = G^{(0)} \supseteq G^{(1)} \supseteq G^{(2)} \supseteq \dots$$

is called the derived series of G .

Thm. Let G be a group. Then,

G is solvable if and only if $G^{(r)} = 1$ for some $r \in \mathbb{N} \cup \{0\}$.

Proof. Suppose that G is solvable. That is, there is a subnormal series $1 = H_r \triangleleft H_{r-1} \triangleleft \dots \triangleleft H_1 \triangleleft H_0 = G$ such that H_i/H_{i+1} is abelian for all $0 \leq i \leq r-1$.

Since H_i/H_{i+1} is abelian if and only if $H_i' = [H_i, H_i] \leq H_{i+1}$, so G/H_1 is abelian $\Leftrightarrow G' = G^{(1)} \leq H_1$
 H_1/H_2 is abelian $\Leftrightarrow$
