Let $F$ be a field, and $S_n$ be a symmetric group on $n$-letters.
Consider the Group-Action of $S_n$ on $M_{n\times n}(F)$
First, for standard-basis $\{e_1, \cdots, e_n\}$ for $F^n$, we can denote as

$$A = \begin{pmatrix} \underbrace{Ae_1}_{n\times 1} & \cdots & Ae_n \end{pmatrix} = \begin{pmatrix} e_1 A \\ \vdots \\ \underbrace{e_n A}_{1\times n} \end{pmatrix}$$

Now, define the Right Action on $M_{n\times n}$ by $S_n$ as;

$$M_{n\times n} \times S_n \to M_{n\times n} : (A, \sigma) \mapsto \left( Ae_{\sigma(1)} \cdots Ae_{\sigma(n)} \right) \left( \overset{\text{denote}}{=} A_\sigma \right) \left( = A \cdot E_\sigma \right)$$

And similarly, define the Left Action;

$$S_n \times M_{n\times n} \to M_{n\times n} : (\sigma, A) \mapsto \begin{pmatrix} e_{\sigma(1)} A \\ \vdots \\ e_{\sigma(n)} A \end{pmatrix} \left( \overset{\text{denote}}{=} \sigma A \right)$$

And, define the Conjugation Action;

$$S_n \times M_{n\times n} \to M_{n\times n} : (\sigma, A) \mapsto E_\sigma^{-1} \cdot A \cdot E_\sigma \left( \overset{\text{denote}}{=} \sigma(A) \right)$$

Note; $E_\sigma^{-1} = E_{\sigma^{-1}}$

[Prop. For any diagonal Matrix $D$ and permutation $\sigma \in S_n$, $\sigma^{-1} D \sigma$ is diagonal with $\sim D$.

Proof. Let $D = \begin{pmatrix} \lambda_1 & & 0 \\ & \ddots & \\ 0 & & \lambda_n \end{pmatrix}$ denote the diagonal Matrix.

Let $\tau = (i\ j) \in S_n$ $(1 \le i < j \le n)$ be a transposition.

Put $E_{i,j} = \begin{pmatrix} e_{\tau(1)} & \cdots & e_{\tau(n)} \end{pmatrix}$. Then, by simple calculation, $E_{i,j}^{-1} = E_{i,j}$.

Moreover, for any $A = \begin{pmatrix} \alpha_1 & \cdots & \alpha_n \end{pmatrix}$, $AE_{i,j} = \begin{pmatrix} \alpha_{\tau(1)} & \cdots & \alpha_{\tau(n)} \end{pmatrix}$, and similarly

$$E_{i,j} A = \begin{pmatrix} \beta_{\tau(1)} \\ \vdots \\ \beta_{\tau(n)} \end{pmatrix} \text{ where } A = \begin{pmatrix} \beta_1 \\ \vdots \\ \beta_n \end{pmatrix}.$$

Therefore, $E_{i,j} \cdot D \cdot E_{i,j} = \begin{pmatrix} \lambda_{\tau(1)} & & \\ & \ddots & \\ & & \lambda_{\tau(n)} \end{pmatrix} \sim D$

Finally, since every permutation can be represented by Product of transposition, we obtain the result, inductively.
